Production:
Social Responsibility Considerations

Intended for beginner compliance programs

Key activity: Product testing; production monitoring

Step-by-step approach to consider risk related to social responsibility during the production stage.

- If not already completed, perform a social accountability audit to identify potential hazards.

- Create a corrective action plan (CAP) that includes all audit findings.
  - The CAP should outline appropriate steps to resolve the problem, including a root causes analysis, corrective and preventative action, and proof that the finding was addressed (e.g. photo or document).

- Review the results of all inspections with the factory management team so that the factory can develop a corrective action plan to address any deficiencies found.
